

# Exercises Week 5

2

$$X(z) = \frac{7}{(1-2z^{-1})(1+0.5z^{-1})} \cdot z^2$$

$$= \frac{7z^2}{(z-2)(z+0.5)}$$

$$Az + A \cdot 0.5 + Bz + 0.5B = 7z \Rightarrow \begin{cases} A+B=7 \\ 0.5A+0.5B=0 \end{cases}$$

$$\frac{X(z)}{z} = \frac{7 \cdot z}{(z-2)(z+0.5)} = \frac{A}{z-2} + \frac{B}{z+0.5} \quad | \cdot z$$

$$A = \frac{7z}{(z+0.5)} \Big|_{z=-0.5} = \frac{7 \cdot (-0.5)}{-0.5+0.5} = \frac{7 \cdot (-0.5)}{-2.5} = \frac{14}{5} = 2.8$$

$$B = \frac{7z}{z-2} \Big|_{z=2} = \frac{-0.5 \cdot 7}{-2.5} = \frac{3.5}{2.5} = 1.4$$

$$X(z) = A \cdot \frac{z}{z-2} + B \cdot \frac{z}{z+0.5} = 2.8 \frac{z}{z-2} + 1.4 \frac{z}{z+0.5}$$

ROC: I  $|z| < 0.5 < 2$

anti-causal  $x[n] = \underbrace{2.8 \cdot (-2^m u[-m-1])}_{\text{anti-causal}} + \underbrace{1.4 \cdot (-(-0.5)^m u[-m-1])}_{\text{anti-causal}}$

II  $0.5 < |z| < 2$

bilateral  $x[n] = \underbrace{2.8 \cdot (-2^m u[-m-1])}_{\text{anti-causal}} + \underbrace{1.4 \cdot (-0.5)^m u[m]}_{\text{causal}}$

III  $0.5 < 2 < |z|$

causal  $x[n] = \underbrace{2.8 \cdot 2^m u[n]}_{\text{causal}} + \underbrace{1.4 \cdot (-0.5)^m u[n]}_{\text{causal}}$

$2^m u[n]$  :

$u[-m-1] = b[m]$
